## Impact of sowing date and mulching on the incidence of okra shoot and fruit borer

**Shraddha S Dahivalkar, VS Desai, GM Golvankar and PB Shinde**

### Abstract

The field experiment was conducted to study the impact of sowing date and mulching on the incidence of okra shoot and fruit borer during *rabi* hot weather season of 2016-2017 at Agronomy farm, College of Agriculture, Dapoli. The results indicated that the data on effect of different sowing dates on per cent fruit infestation of okra shoot and fruit borer was recorded from 8<sup>th</sup> WAS to 12<sup>th</sup> WAS. During 8<sup>th</sup>, 9<sup>th</sup>, 10<sup>th</sup>, 11<sup>th</sup> and 12<sup>th</sup> WAS, the minimum (3.63%, 5.77%, 8.82%, 6.26% and 7.77, respectively) per cent fruit infestation was recorded in treatment S<sub>1</sub> (46<sup>th</sup> SMW, 12<sup>th</sup>-18<sup>th</sup> Nov.) The maximum (10.13%) fruit infestation by shoot and fruit borer was recorded in treatment S<sub>6</sub> (9<sup>th</sup> SMW, 26<sup>th</sup>-Feb.-4<sup>th</sup> Mar).

The results on effect of different mulches on per cent fruit infestation of okra shoot and fruit borer during 8<sup>th</sup>, 9<sup>th</sup>, 10<sup>th</sup>, 11<sup>th</sup> and 12<sup>th</sup> WAS indicated that the minimum (3.87%, 6.27%, 9.20%, 6.43% and 4.89%, respectively) fruit infestation was recorded in treatment M<sub>2</sub> (Silver polythene mulch). The maximum (11.62%, 15.28%, 17.09%, 15.59% and 12.49%, respectively) fruit infestation was recorded in treatment M<sub>1</sub> (No mulch).

The data recorded on combination effect of different sowing dates and mulches on infestation of okra shoot and fruit borer was recorded from 8<sup>th</sup> WAS to 12<sup>th</sup> WAS. During 8<sup>th</sup>, 9<sup>th</sup>, 10<sup>th</sup>, 11<sup>th</sup> and 12<sup>th</sup> WAS, the minimum (1.23%, 3.17%, 6.20%, 3.33% and 2.33%, respectively) fruit infestation was recorded in treatment combinations S<sub>1</sub>M<sub>2</sub> [S<sub>1</sub> (46<sup>th</sup> SMW, 12<sup>th</sup>-18<sup>th</sup> Nov.) + M<sub>2</sub> (Silver polythene mulch)] and S<sub>2</sub>M<sub>2</sub> [S<sub>2</sub> (49<sup>th</sup> SMW, 3<sup>rd</sup>-9<sup>th</sup> Dec.) + M<sub>2</sub> (Silver polythene mulch)] and both these treatment combinations were significantly superior over other treatment combinations. The maximum (11.10%, 14.54%, 15.93%, 14.78 and 11.98%, respectively) fruit infestation was recorded in treatment combination S<sub>6</sub>M<sub>1</sub> [S<sub>6</sub> (9<sup>th</sup> SMW, 26<sup>th</sup>-Feb.-4<sup>th</sup> Mar) + M<sub>1</sub> (No mulch)].

**Keywords:** Sowing date, *Earias vittella*, okra shoot and fruit borer, mulch

### Introduction

Okra, *Abelmoschus esculentus* Linn (Moench) is an important vegetable crop in tropics and subtropics region. It is the second most preferred vegetable (next to brinjal) in India. It is an important source of vitamin A, B and C and is also rich in protein, carbohydrates, fats and iron. It is also a rich source of dietary fibre, antioxidants, ascorbic acid and folate (Dilruba *et al.*, 2009) [5].

Okra is mainly cultivated in India under the states of Uttar Pradesh, Karnataka, Gujarat and Maharashtra. Area under this crop in Maharashtra state is 0.023 Mha with production of 241.50 MT and productivity of 10.50 MT/ ha (Anon., 2015) [2]. It is extensively grown in Ahmednagar, Amravati, Nagpur, Aurangabad, Dhule, Jalgaon, Nasik, Osmanabad, Parbhani and Pune districts in the state of Maharashtra.

The crop is attacked by a variety of pests throughout its growth stages (Rao *et al.*, 2002) [8]. Amongst them okra shoot and fruit borer (*Earias vittella* Fabricius, Lepidoptera: Noctuidae) is of much significance (Gautam *et al.*, 2014) [6] and causes extensive damage to fruits resulting in 69 per cent yield loss (Atwal and Singh 1990) [3] and 8.40 to 73.20 per cent variation in fruit infestation (Kumar and Urs 1988) [7]. It is an endemic pest and inflicts direct loss to the crop. It is an oligophagus pest and okra and cotton are its main host plants. It is also found feeding on a large number of malvaceous crop plants.

For the management of insect pests and diseases many options such as chemical, cultural, mechanical, biological *etc.* are available. Among available control methods, cultural method is considered to be the safest and environment friendly. Many cultural practices can be usually employed in an IPM scheme such as sanitation or destruction of debris, destruction of alternate hosts and volunteer plants, changing dates of planting and harvesting to avoid pest attack, crop rotation to avoid built of pests, tillage practices, habitat diversification, cropping systems or

intercropping, plant density, trap crops, water management, etc. The mulches are used to control pest, diseases, weeds and maintaining soil moisture. The benefits and importance of mulching in modern agriculture respective to the type of material used have been stressed by many authors (Agropages, 2009) [1]. The information on effect of sowing dates and mulching practices on okra shoot and fruit borer in Konkan region of Maharashtra is very scanty. Hence, the present investigation carried out to study the impact of sowing date and mulching on the incidence of okra shoot and fruit borer.

## Materials and Methods

A statistically designed field experiment using Split Plot Design having replications and treatments was laid out at Department of Agronomy farm, College of Agriculture, Dapoli to evaluate effect of sowing dates and mulches against pests of okra. The details of the experiment are given below;

Location: Department of Agronomy farm, College of Agriculture, Dapoli

Name of crop: Okra

Variety: Varsha Uphar

Design of experiment: Split plot design

Replications: 3 (Three)

Spacing: 45 cm x 30 cm

Method of Planting: Gross area - 4.20m x 3.6m

Net area - 3.60m x 2.70m

Method of Planting: Flat bed

Season and Year: Rabi-hot weather, 2016-17

Dose of fertilizers: 100:50:25 NPK Kg/ha

## Treatments

### 1. Main Plot Treatments (Sowing dates)

S<sub>1</sub>: 46<sup>th</sup> MW (12-18<sup>th</sup> November)

S<sub>2</sub>: 49<sup>th</sup> MW (03-09<sup>th</sup> December)

S<sub>3</sub>: 52<sup>nd</sup> MW (24-31<sup>st</sup> December)

S<sub>4</sub>: 03<sup>rd</sup> MW (15-21<sup>st</sup> January)

S<sub>5</sub>: 06<sup>th</sup> MW (05-11<sup>th</sup> February)

S<sub>6</sub>: 09<sup>th</sup> MW (26<sup>th</sup> Feb.- 4<sup>th</sup> March)

### 2. Sub plot Treatment (Mulches)

M<sub>1</sub>: No mulch

M<sub>2</sub>: Silver polythene mulch

M<sub>3</sub>: Transparent polythene mulch

M<sub>4</sub>: Black polythene mulch

## Method of recording observations

The observations of okra shoot and fruit borer was recorded as soon as the incidence is noticed. For okra shoot and fruit borer, per cent fruit infestation was calculated on the number basis, number of healthy and infested fruits at each picking on randomly selected five plants per treatment plot. Per cent fruit infestation was calculated by the following formula:

$$\text{Per cent fruit infestation} = \frac{\text{No. of infested fruits}}{\text{Total number of fruits}} \times 100$$

Data on per cent fruit infestation was converted to arcsine transformation and analyzed statistically.

## Results and Discussion

### 1. Effect of sowing dates on per cent infestation by okra shoot and fruit borer

The data pertaining to the per cent fruit infestation by okra

shoot and fruit borer are given in Table 1.

The incidence of shoot and fruit borer was not observed on okra shoots whereas, fruit infestation was started from 8<sup>th</sup> WAS. The data revealed that the effect of different sowing dates on per cent fruit infestation of okra shoot and fruit borer was recorded from 8<sup>th</sup> WAS to 12<sup>th</sup> WAS. During 8<sup>th</sup> WAS, the minimum (3.63%) per cent fruit infestation was recorded in treatment S<sub>1</sub> (46<sup>th</sup> SMW, 12<sup>th</sup>-18<sup>th</sup> Nov.) and was found to be at par with the treatment S<sub>2</sub> (49<sup>th</sup> SMW, 3<sup>rd</sup>-9<sup>th</sup> Dec.) with 4.78 per cent fruit infestation. The maximum (10.13%) fruit infestation by shoot and fruit borer was recorded in treatment S<sub>6</sub> (9<sup>th</sup> SMW, 26<sup>th</sup>-Feb.-4<sup>th</sup> Mar).

Data during 9<sup>th</sup> WAS revealed that the least (5.77%) per cent fruit infestation was recorded in S<sub>1</sub> (46<sup>th</sup> SMW, 12<sup>th</sup>-18<sup>th</sup> Nov.) and was found to be at par with treatment S<sub>2</sub> (49<sup>th</sup> SMW, 3<sup>rd</sup>-9<sup>th</sup> Dec.) which recorded 7.39 per cent fruit infestation. The highest (14.27%) fruit infestation was recorded in treatment S<sub>6</sub> (9<sup>th</sup> SMW, 26<sup>th</sup>-Feb.-4<sup>th</sup> Mar).

The data recorded on per cent fruit infestation by okra shoot and fruit borer during 10<sup>th</sup> WAS showed that the lowest (8.82%) was noticed in S<sub>1</sub> (46<sup>th</sup> SMW, 12<sup>th</sup>-18<sup>th</sup> Nov.) and was at par with the treatment S<sub>2</sub> (49<sup>th</sup> SMW, 3<sup>rd</sup>-9<sup>th</sup> Dec.) and S<sub>3</sub> (52<sup>nd</sup> SMW, 24<sup>th</sup>-31<sup>st</sup> Dec.) with 10.49 and 11.57 per cent, respectively. The per cent infestation was maximum (19.46%) in treatment S<sub>6</sub> (9<sup>th</sup> SMW, 26<sup>th</sup>-Feb.-4<sup>th</sup> Mar).

During 11<sup>th</sup> WAS, results revealed that the minimum (6.26%) per cent infestation was observed in S<sub>1</sub> (46<sup>th</sup> SMW, 12<sup>th</sup>-18<sup>th</sup> Nov.) and was at par with the treatment S<sub>2</sub> (49<sup>th</sup> SMW, 3<sup>rd</sup>-9<sup>th</sup> Dec.) with 7.57 per cent. The maximum (14.51%) per cent fruit infestation was recorded in treatment S<sub>6</sub> (9<sup>th</sup> SMW, 26<sup>th</sup>-Feb.-4<sup>th</sup> Mar).

Data regarding per cent fruit infestation by okra shoot and fruit borer during 12<sup>th</sup> WAS indicated that the treatment S<sub>1</sub> (46<sup>th</sup> SMW, 12<sup>th</sup>-18<sup>th</sup> Nov.) recorded lowest (7.77%) fruit infestation and was at par with S<sub>2</sub> (49<sup>th</sup> SMW, 3<sup>rd</sup>-9<sup>th</sup> Dec.) which recorded 5.80 per cent infestation. The treatment S<sub>6</sub> (9<sup>th</sup> SMW, 26<sup>th</sup>-Feb.-4<sup>th</sup> Mar) recorded maximum (11.06%) fruit infestation.

The results of the earlier workers are more or less similar with the present findings. Shukla *et al.* (1997) [9] reported that fruit infestation started at the beginning of fruiting, increased progressively up to harvesting and reached a peak (41.25%) before harvesting in the first fortnight of June.

Bairwa *et al.* (2005) [4] observed increase in infestation of the shoot and fruit borer and decrease in yield of okra fruit with the advancement of sowing time.

Vanaldiki *et al.* (2017) [10] reported that there was significant difference in the infestation of the fruit borer due to staggered sowing. The infestation varied from 40.45 to 25.68 per cent, with the least one of 4.45 per cent observed in the early sown crop (20 January). This was followed by those sown on 6 and 21 February, 8 and 23 March, and 8 April, with fruit damage increasing with delayed sowings. Similar trends were observed in 2012. The pooled data also revealed that the infestation increased with delayed sowing, reaching up to 24.57 per cent.

### 2. Effect of mulches on per cent infestation by okra shoot and fruit borer

The results on different mulches on per cent fruit infestation of okra shoot and fruit borer are presented in Table 2.

The results on effect of different mulches on per cent fruit infestation of okra shoot and fruit borer during 8<sup>th</sup> WAS indicated that the minimum (3.87%) fruit infestation was

recorded in treatment M<sub>2</sub> (Silver polythene mulch) and was found to be at par with the treatment M<sub>3</sub> (White polythene mulch) with 5.38 per cent fruit infestation. The maximum (11.62) fruit infestation was recorded in treatment M<sub>1</sub> (No mulch).

Data recorded during 9<sup>th</sup> WAS indicated that the least (6.27%) fruit infestation were recorded in M<sub>2</sub> (Silver polythene mulch) and was found to be at par with the treatment M<sub>3</sub> (White polythene mulch) with 7.80 per cent fruit infestation. The treatment M<sub>1</sub> (No mulch) recorded maximum (15.28%) fruit infestation.

The observation recorded on per cent fruit infestation by shoot and fruit borer during 10<sup>th</sup> WAS showed that the lowest (9.20%) was noticed in M<sub>2</sub> (Silver polythene mulch) and was at par with the treatment M<sub>3</sub> (White polythene mulch) with 12.68 per cent fruit infestation. The per cent fruit infestation was highest (17.09%) in treatment M<sub>1</sub> (No mulch).

During 11<sup>th</sup> WAS, results revealed that the minimum (6.43%) per cent fruit infestation was observed in M<sub>2</sub> (Silver polythene mulch) and was at par with the treatment M<sub>3</sub> (White polythene mulch) with 8.09 per cent. The maximum (15.59%) fruit infestation was recorded in treatment M<sub>1</sub> (No mulch).

Data on per cent fruit infestation during 12<sup>th</sup> WAS indicated that the treatment M<sub>2</sub> (Silver polythene mulch) recorded lowest (4.89%) fruit infestation and was at par with M<sub>3</sub> (White polythene mulch) which recorded 6.29 per cent fruit infestation. The treatment M<sub>1</sub> (No mulch) recorded maximum (12.49%) per cent fruit infestation.

No review of literature related to effect of mulching on okra shoot and fruit borer aspect is available. Hence, no review has been included and the obtained data remains uncomparable.

### 3. Combination effect of sowing dates and mulches on per cent infestation by okra shoot and fruit borer

The data regarding combination effect of sowing dates and mulches on per cent fruit infestation by shoot and fruit borer are presented in Table 3.

The data revealed that the combination effect of different sowing dates and mulches on infestation of shoot and fruit borer was recorded from 8<sup>th</sup> WAS to 12<sup>th</sup> WAS. During 8<sup>th</sup> WAS, the minimum (1.23%) fruit infestation was recorded in treatment combinations S<sub>1</sub>M<sub>2</sub> [S<sub>1</sub> (46<sup>th</sup> SMW, 12<sup>th</sup>-18<sup>th</sup> Nov.) + M<sub>2</sub> (Silver polythene mulch)] and S<sub>2</sub>M<sub>2</sub> [S<sub>2</sub> (49<sup>th</sup> SMW, 3<sup>rd</sup>-9<sup>th</sup> Dec.) + M<sub>2</sub> (Silver polythene mulch)] and both these treatment combinations were significantly superior over other treatment combinations. The next best treatment combinations were S<sub>3</sub>M<sub>2</sub> [S<sub>3</sub> (52<sup>nd</sup> SMW, 24<sup>th</sup>-31<sup>st</sup> Dec.) + M<sub>2</sub> (Silver polythene mulch)], S<sub>4</sub>M<sub>2</sub> [S<sub>4</sub> (3<sup>rd</sup> SMW, 15<sup>th</sup>- 31<sup>st</sup>Jan.) + M<sub>2</sub> (Silver polythene mulch)], S<sub>5</sub>M<sub>2</sub> [S<sub>5</sub> (6<sup>th</sup> SMW, 5<sup>th</sup> -11<sup>th</sup> Feb.) + M<sub>2</sub> (Silver polythene mulch)] and S<sub>6</sub>M<sub>2</sub> [S<sub>6</sub> (9<sup>th</sup> SMW, 26<sup>th</sup>-Feb.-4<sup>th</sup> Mar) + M<sub>2</sub> (Silver polythene mulch)] and all these combinations recorded 2.28 per cent fruit infestation. The maximum (11.10%) fruit infestation was recorded in treatment combination S<sub>6</sub>M<sub>1</sub> (S<sub>6</sub> (9<sup>th</sup> SMW, 26<sup>th</sup>-Feb.-4<sup>th</sup> Mar) + M<sub>1</sub> (No mulch)).

Data during 9<sup>th</sup> WAS, revealed that the least (3.17%) fruit infestation were recorded in treatment combinations S<sub>1</sub>M<sub>2</sub> [S<sub>1</sub> (46<sup>th</sup> SMW, 12<sup>th</sup>-18<sup>th</sup> Nov.) + M<sub>2</sub> (Silver polythene mulch)] and S<sub>2</sub>M<sub>2</sub> [S<sub>2</sub> (49<sup>th</sup> SMW, 3<sup>rd</sup>-9<sup>th</sup> Dec.) + M<sub>2</sub> (Silver polythene mulch)] and both these treatment combinations were significantly superior over rest of the treatment combinations. The next best treatment combinations were S<sub>1</sub>M<sub>3</sub> [S<sub>1</sub> (46<sup>th</sup>

SMW, 12<sup>th</sup>-18<sup>th</sup> Nov.) + M<sub>3</sub> (White polythene mulch)], S<sub>2</sub>M<sub>3</sub> [S<sub>2</sub> (49<sup>th</sup> SMW, 3<sup>rd</sup>-9<sup>th</sup> Dec.) + M<sub>3</sub> (White polythene mulch)] and S<sub>3</sub>M<sub>2</sub> [S<sub>3</sub> (52<sup>nd</sup> SMW, 24<sup>th</sup>-31<sup>st</sup> Dec.) + M<sub>2</sub> (Silver polythene mulch)] which recorded 4.16 per cent fruit infestation each. The highest (14.54%) fruit infestation was recorded in treatment combination S<sub>6</sub>M<sub>1</sub> (S<sub>6</sub> (9<sup>th</sup> SMW, 26<sup>th</sup>-Feb.-4<sup>th</sup> Mar.) + M<sub>1</sub> (No mulch)).

The data recorded on per cent fruit infestation during 10<sup>th</sup> WAS showed that the lowest (6.20%) fruit infestation was recorded in treatment combinations S<sub>1</sub>M<sub>2</sub> [S<sub>1</sub> (46<sup>th</sup> SMW, 12<sup>th</sup>-18<sup>th</sup> Nov.) + M<sub>2</sub> (Silver polythene mulch)] and S<sub>2</sub>M<sub>2</sub> [S<sub>2</sub> (49<sup>th</sup> SMW, 3<sup>rd</sup>-9<sup>th</sup> Dec.) + M<sub>2</sub> (Silver polythene mulch)] which was found to be at par with the treatment combinations S<sub>3</sub>M<sub>2</sub> [S<sub>3</sub> (52<sup>nd</sup> SMW, 24<sup>th</sup>-31<sup>st</sup> Dec.) + M<sub>2</sub> (Silver polythene mulch)], S<sub>4</sub>M<sub>2</sub> [S<sub>4</sub> (3<sup>rd</sup> SMW, 15<sup>th</sup>- 31<sup>st</sup>Jan.) + M<sub>2</sub> (Silver polythene mulch)], S<sub>5</sub>M<sub>2</sub> [S<sub>5</sub> (6<sup>th</sup> SMW, 5<sup>th</sup> -11<sup>th</sup> Feb.) + M<sub>2</sub> (Silver polythene mulch)], S<sub>6</sub>M<sub>2</sub> [S<sub>6</sub> (9<sup>th</sup> SMW, 26<sup>th</sup>-Feb.-4<sup>th</sup> Mar.) + M<sub>2</sub> (Silver polythene mulch)], S<sub>1</sub>M<sub>3</sub> [S<sub>1</sub> (46<sup>th</sup> SMW, 12<sup>th</sup>-18<sup>th</sup> Nov.) + M<sub>3</sub> (White polythene mulch)], S<sub>2</sub>M<sub>3</sub> [S<sub>2</sub> (49<sup>th</sup> SMW, 3<sup>rd</sup>-9<sup>th</sup> Dec.) + M<sub>3</sub> (White polythene mulch)] and S<sub>3</sub>M<sub>3</sub> [S<sub>3</sub> (52<sup>nd</sup> SMW, 24<sup>th</sup>-31<sup>st</sup> Dec.) + M<sub>3</sub> (White polythene mulch)] with 7.42, 7.42, 7.42, 7.42, 7.70, 7.70 and 7.70 per cent, respectively. The highest (15.93%) fruit infestation was recorded in treatment combination S<sub>6</sub>M<sub>1</sub> (S<sub>6</sub> (9<sup>th</sup> SMW, 26<sup>th</sup>-Feb.-4<sup>th</sup> Mar) + M<sub>1</sub> (No mulch)).

During 11<sup>th</sup> WAS, results revealed that the minimum (3.33%) fruit infestation was observed in treatment combinations S<sub>1</sub>M<sub>2</sub> [S<sub>1</sub> (46<sup>th</sup> SMW, 12<sup>th</sup>-18<sup>th</sup> Nov.) + M<sub>2</sub> (Silver polythene mulch)] and S<sub>2</sub>M<sub>2</sub> [S<sub>2</sub> (49<sup>th</sup> SMW, 3<sup>rd</sup>-9<sup>th</sup> Dec.) + M<sub>2</sub> (Silver polythene mulch)] and both these treatment combinations were significantly superior over rest of the treatment combinations. The next best treatment combinations were S<sub>3</sub>M<sub>2</sub> [S<sub>3</sub> (52<sup>nd</sup> SMW, 24<sup>th</sup>-31<sup>st</sup> Dec.) + M<sub>2</sub> (Silver polythene mulch)], S<sub>4</sub>M<sub>2</sub> [S<sub>4</sub> (3<sup>rd</sup> SMW, 15<sup>th</sup>- 31<sup>st</sup>Jan.) + M<sub>2</sub> (Silver polythene mulch)], S<sub>5</sub>M<sub>2</sub> [S<sub>5</sub> (6<sup>th</sup> SMW, 5<sup>th</sup> -11<sup>th</sup> Feb.) + M<sub>2</sub> (Silver polythene mulch)] and S<sub>6</sub>M<sub>2</sub> [S<sub>6</sub> (9<sup>th</sup> SMW, 26<sup>th</sup>-Feb.-4<sup>th</sup> Mar.) + M<sub>2</sub> (Silver polythene mulch)] and all these treatment combinations recorded 4.61 per cent fruit infestation. The maximum (14.78%) fruit infestation was recorded in treatment combination S<sub>6</sub>M<sub>1</sub> (S<sub>6</sub> (9<sup>th</sup> SMW, 26<sup>th</sup>-Feb.-4<sup>th</sup> Mar) + M<sub>1</sub> (No mulch)).

Data regarding per cent fruit infestation by okra shoot and fruit borer during 12<sup>th</sup> WAS indicated that the treatment combinations S<sub>1</sub>M<sub>2</sub> [S<sub>1</sub> (46<sup>th</sup> SMW, 12<sup>th</sup>-18<sup>th</sup> Nov.) + M<sub>2</sub> (Silver polythene mulch)] and S<sub>2</sub>M<sub>2</sub> [S<sub>2</sub> (49<sup>th</sup> SMW, 3<sup>rd</sup>-9<sup>th</sup> Dec.) + M<sub>2</sub> (Silver polythene mulch)] recorded minimum (2.33%) fruit infestation and both these treatment combinations were significantly superior over other treatments. The next best treatment combinations were S<sub>3</sub>M<sub>2</sub> [S<sub>3</sub> (52<sup>nd</sup> SMW, 24<sup>th</sup>-31<sup>st</sup> Dec.) + M<sub>2</sub> (Silver polythene mulch)], S<sub>4</sub>M<sub>2</sub> [S<sub>4</sub> (3<sup>rd</sup> SMW, 15<sup>th</sup>- 31<sup>st</sup>Jan.) + M<sub>2</sub> (Silver polythene mulch)], S<sub>5</sub>M<sub>2</sub> [S<sub>5</sub> (6<sup>th</sup> SMW, 5<sup>th</sup> -11<sup>th</sup> Feb.) + M<sub>2</sub> (Silver polythene mulch)] and S<sub>6</sub>M<sub>2</sub> [S<sub>6</sub> (9<sup>th</sup> SMW, 26<sup>th</sup>-Feb.-4<sup>th</sup> Mar) + M<sub>2</sub> (Silver polythene mulch)] and all these treatment combinations recorded 3.36 per cent fruit infestation. The treatment combination S<sub>6</sub>M<sub>1</sub> (S<sub>6</sub> (9<sup>th</sup> SMW, 26<sup>th</sup>-Feb.-4<sup>th</sup> Mar) + M<sub>1</sub> (No mulch)) was recorded highest (11.98%) fruit infestation.

No review of literature related to aspect the combination effect of sowing dates and mulches on infestation of okra shoot and fruit borer is available. Hence, no review has been included and the obtained data remain uncomparable.

**Conclusion**

Date of sowing is one of the best cultural practice use by farmers to escape, avoided the pest infestation on the crop and get appropriate yield as well as income. From the present investigation, it can be concluded as the okra crop was cultivated at early sowing date S<sub>1</sub> (46<sup>th</sup> SMW, 12<sup>th</sup>-18<sup>th</sup> Nov.)

recorded minimum per cent fruit infestation over the treatment S<sub>6</sub> (9<sup>th</sup> SMW, 26<sup>th</sup>-Feb.-4<sup>th</sup> Mar). Similarly, in treatment M<sub>2</sub> (Silver polythene mulch) was noticed minimum fruit infestation over the treatment M<sub>1</sub> (No mulch). The treatment combinations S<sub>1</sub>M<sub>2</sub> [S<sub>1</sub> (46<sup>th</sup> SMW, 12<sup>th</sup>-18<sup>th</sup> Nov.) + M<sub>2</sub> (Silver polythene mulch)] and S<sub>2</sub>M<sub>2</sub> [S<sub>2</sub> (49<sup>th</sup> SMW, 3<sup>rd</sup>-

9<sup>th</sup> Dec.) + M<sub>2</sub> (Silver polythene mulch)] and both these treatment combinations were significantly superior over other treatment combinations for reducing the fruit infestation. While, in treatment combination S<sub>6</sub>M<sub>1</sub> [(S<sub>6</sub> (9<sup>th</sup> SMW, 26<sup>th</sup>-Feb.-4<sup>th</sup> Mar) + M<sub>1</sub> (No mulch))] was recorded maximum fruit infestation in okra. The results showed that the infestation of the shoot and fruit borer increased with the delay in sowing of the crop and without mulching practices.
